Gunasinghe K L

1. Evidence-Based Self-Reflection & Lecture Impact Analysis

In my second year, I failed the Interactive Web Technologies (IWT) module, which was a big deal for me. I missed both the assignment deadline and the viva. This happened because the person didn't plan ahead and didn't manage their time well. At that time, I was working on a lot of schoolwork and dealing with personal issues, and I didn't realise how important the submission deadline was. Because of this, I didn't finish the work on time and had to take the module again as a prorata.

In this case, I was the student who had to do the work, and the academic staff were the ones who had to grade it. The result was bad because I lost points and had to wait longer to finish my studies. But this experience taught me a lot about how ready I am to get a job. It showed that I could understand technical information, but my discipline and time management skills were not at a professional level. In a real job, acting this way could cause you to miss deadlines and lose your boss's trust.

Self-Rating with Evidence

- **Accountability: 4/5**
I own up to my mistakes and take responsibility for my work, as shown by how I accepted the consequences of missing the IWT deadline.
Risk: I might still put off taking full responsibility in new or stressful situations until things get really bad..
- **Communication: 5/5**
I take part in group discussions and presentations, and I make sure to clearly explain my ideas when I do academic work.
Risk: Sometimes I think I'm clearer than I really am, especially when I try to explain technical ideas to people who aren't technical.
- **Teamwork: 4/5**
I have worked well with others on many group projects, sharing tasks and helping my teammates get things done quickly.
Risk: I might depend too much on the team to work together and not push myself to take charge or lead when I need to..
- **Adaptability: 3/5**
I learn quickly and can get used to new technologies like Flutter and other development tools in a short amount of time.
Risk: When I'm under a lot of stress, I might not be as flexible, which could hurt my performance.
- **Professional Discipline: 4/5**
I usually do my schoolwork and go to class on time.

Risk: If not controlled, bad time management can still have serious effects, as shown by the IWT incident..

Lecture Impact

"Application of Soft Skills" was a lecture that really stuck with me. One important point made in this lecture was that you need to use soft skills like communication, teamwork, and adaptability in the right way for the situation and environment.).

This idea made me think a lot differently. I used to think that having only technical skills was enough to get ahead. But after thinking about my IWT failure, I realized that my problem wasn't that I didn't know enough, but that I didn't have enough self-control and didn't use soft skills like time management and responsibility correctly. The lecture taught me that being able to get a job isn't just about what I know; it's also about how I act and do things in real life. This has made me want to work harder on my self-discipline and professional behavior..

2. Industry Alignment & Professional Judgment

I thought about applying for a typical entry-level Software Engineer or Flutter Developer job at a software development company.

Required Skills and Self-Assessment

1. Making mobile apps with Flutter

This includes making the UI, keeping track of the state, and connecting APIs.

I meet this requirement at a basic to intermediate level because I have learned Flutter and made small apps before. But I need more experience working on real projects to feel more sure of myself.

2. Thinking logically and solving problems

Employers want developers to fix bugs and write code that works well.

I have a good base in problem-solving from school projects, but I still need to get better at dealing with complicated problems on my own in the real world.

3. Git for version control and working together

This means working with groups of people using tools like Git and GitHub.

I know the basics of Git, but I need more real-world experience working with others, like in team-based development workflows.

Ethical Scenario Response

If I find a serious bug right before a deadline and my Team Lead tells me to ignore it to avoid a delay, I won't. Instead, I would make the risks clear and talk about how releasing a faulty product could affect things.

This choice shows that I value responsibility, honesty, and professionalism. If you ship a product with a major bug, it could hurt the company's reputation and make users less likely to trust you. I think it's important to put quality and long-term results ahead of short-term deadlines, even if it means more stress or conflict.

I think I can act professionally under pressure, but it might be hard to do so in real life. The IWT incident and other things I've done in school have taught me how important it is to be responsible and make better choices. This makes me more mentally prepared to deal with these kinds of situations in a moral way in the future.

3. My Immediate Upgrade Plan

In the next six months, I will do the following things to get ready for work:

1. Make two full Flutter apps

To get better at practical development, I will make at least two fully working Flutter projects (like a task manager and an e-commerce app) and put them on GitHub within four months..

2. Use a structured plan to get better at managing your time.

I will stick to a weekly schedule and use tools like Notion or Google Calendar to keep track of my tasks and deadlines. To avoid making the same mistakes again, like missing deadlines, I will stick to this for six months..

3. Learn Git and Team Collaboration Practices

Within two to three months, I will finish an online Git training program and employ GitHub for version control in my assignments. In addition, I plan to work on a group assignment together with other students.

This way, I will be able to work on my weaknesses in terms of self-discipline, hands-on experience, and teamwork abilities. After that, I will become better prepared to enter the job market as an entry-level software engineer.
